INTERNAL ASSESSMENT PROJECT

Personal Portfolio Website with API-Based Chatbot Integration

Individual Practical Assessment

Tools: Cursor AI • HTML • CSS • JavaScript • GitHub • Vercel • Chatbot API

1. Project Objective

Build upon the personal portfolio website developed in Lecture 9. Personalize it, showcase the previously completed projects, implement interactive functionality, publish the code to GitHub, deploy the website using Vercel, and integrate a working chatbot using the API method taught in class.

2. Project Requirements

Task 1: Personalize Your Portfolio Website

Open your Lecture 9 portfolio in Cursor AI and replace all placeholders with your actual details.

- Full name and personal introduction
- Educational background and technical skills
- Profile photograph or suitable personal image
- GitHub profile link, projects section, and contact information

No dummy names, sample information, or unchanged placeholders should remain. Improve the visual design, navigation, and responsiveness where appropriate.

Task 2: Add All Previous GitHub Projects

Create a “My Projects” section in portfolio containing these five project entries:

1. Python Programs Collection: Factorial, Fibonacci, and Structure-to-Dictionary conversion and updated readme repository.

2. Messy Python Code Improvement: The messy Python script improved using AI assistance.

3. Bug Fixing Using Cursor AI: An incorrect or buggy program identified and corrected using Cursor.

4. Interactive Quiz Application: The quiz application developed in Lecture 10.

5. Book Reading List Application: The reading list application developed in Lecture 11 with updated readme containing the deployed link to your reading list application.

Display each project as a separate card with its title, brief description, technologies used, and working GitHub repository link. Add a live application link where available.

Task 3: Add Interactive Website Functionality

Mandatory: Implement a Project Search and Filter feature along with light/dark mode toggle. Visitors must be able to find projects by name or technology. For example, searching “Python”, “Quiz”, or “Book” should show relevant project entries. Results should respond to the entered search term.

Task 4: Push Portfolio to GitHub

1. Create a GitHub repository for the final portfolio.
2. Add, commit, and push the completed project files.
3. Create or update README.md with project description, technologies, implemented features, setup instructions, and live website link.

Task 5: Deploy the Website Using Vercel

4. Connect the portfolio GitHub repository to Vercel.
5. Deploy the website and verify it is publicly accessible.
6. Test project links, images, search functionality, and desktop/mobile layouts.

Task 6: Integrate an API-Based Portfolio Chatbot

Integrate a chatbot using the API integration method taught during class. The chatbot must allow visitors to type questions and receive responses grounded in the student's portfolio information.

- Create a visible, usable chatbot interface.
- Connect the chatbot to the API demonstrated in class.
- Provide relevant portfolio/project information for accurate responses.
- Display a useful error message if an API request fails.
- Ensure the chatbot works on the live Vercel deployment.
- Do not expose secret API keys in public source files or GitHub.

Example questions: Who are you? What are your skills? What projects have you completed? Explain your Python programs. What was corrected in the buggy code project? How does the reading list work? Where is your GitHub?

3. Required Website Sections

Home • About Me • Skills • Projects • Contact Information • AI Chatbot

4. Important Instructions

- This is an individual assessment; use the Lecture 9 portfolio as the starting point.
- Replace every placeholder and include all five required project entries.
- Keep all GitHub and deployment links working.
- The search/filter and API-connected chatbot must function on the deployed website.
- Students may use Cursor AI for development and debugging but must understand and explain their implementation.
- Non-functional features, incomplete deployments, or broken links may result in deductions.

5. Project Evaluation

Students may be asked to demonstrate the deployed portfolio, open project repositories, search/filter projects, ask the chatbot portfolio-related questions, and explain how the API is connected.

Expected Outcome: A personalized, responsive portfolio featuring five past projects, project search, GitHub integration, Vercel deployment, and a working API-based chatbot.
